Introduction

About Testing

Web Application Testing Testable Parts

Front-end

- Acceptance Tests and System Tests that run in the browser
- Testing of Web Services with Unit Tests
- Compatibility Testing for Browser/OS/etc. combinations
- Performance Testing
- Security Testing

Back-end

- Functional Testing of business logic with Unit Tests
- Reusable Components, but they often come with their own tests

Testing Methods

Unit Testing

Tests small parts of an application or library (units) for correctly working code. Tools: PHPUnit, SimpleTest System Testing

The testing of a whole integrated system against the specified requirements. Tools: Selenium

Non-functional Testing

Testing for performance, load, stress, reliability, availability, security. Tools: ab, siege, httperf, chorizo

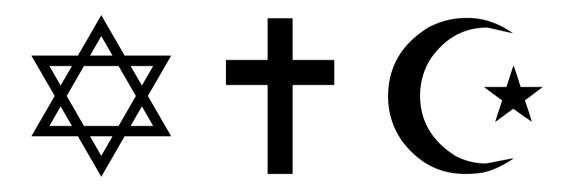

a feature without a test is not a feature

It is not just a method of testing software.

It is a religion.

Back In Time Traditional Development Phases

Requirements Specification

Define what the software is supposed to do.

Design

Define how the software is supposed to be implemented.

Implementation

The implementation of the software itself.

Testing

The implemented software is tested.

Sometimes.

TESTING

I FIND YOUR LACK OF TESTS DISTURBING.

Tests are King

Tests drive the development

- Tests are written before the code
- There is no code without tests

Test Suites

- Contain tests that check whether the code does what it is supposed to do
- Also cover things that should fail

Into the Future Test-Driven Development Phases

Requirements Specification

Define what the software is supposed to do.

Design

Define how the software is supposed to be implemented.

Implementation ≡ Testing

The implemented software is tested.

The implementation of the software itself.

Test-Driven Development eZ Components Development

Present the Idea Write the Requirements Document Design the Component Implementation

- Write API stubs with parameter documentation and descriptions
- Write test cases
- Initial implementation
- Initial implementation review
- Updating implementation according to review
- Implementation review

Pre-release Testing

Test-Driven Development Addressing Defects

Write Test Case

Write a test case to test the correct behavior of the method, and verify that the test case fails

Fix the Issue

Fix the implementation

Verify Fix with Test Case

Make sure that the test cases pass with the new implementation

Check Other Test Cases

Verify that the fix for this defect did not break any other test case

The Way of Testivus

- If you write code, write tests.
- Don't get stuck on unit testing dogma.
- Embrace unit testing karma.
- Think of code and test as one.
- The test is more important than the unit.
- The best time to test is when the code is fresh.
- Tests not run waste away.
- An imperfect test today is better than a perfect test someday.
- An ugly test is better than no test.
- Sometimes, the test justifies the means.
- Only fools use no tools.
- Good tests fail.

TESTING

DON'T BE TOO PROUD OF THIS TECHNOLOGICAL TERROR YOU'VE CONSTRUCTED. THE ABILITY TO DESTROY A PLANET IS INSIGNIFICANT NEXT TO THE POWER OF TESTING.

How much coverage should you aim for?

- It doesn't matter, just write some tests.
- How much rice do I need to cook?
- 100%, and no less!

Un-testable Problems

- Testing singletons more than one time
- System/Operating System dependent tests
- Private methods
- Code that depends on the state of an external resource
- Things that simply should never happen

Politics resistance to change

Developers

Fear - more work to do

- Introduce TDD concepts gently
- Whenever a problem is found, make and retain a test case for futher use
- Start using TDD for new projects

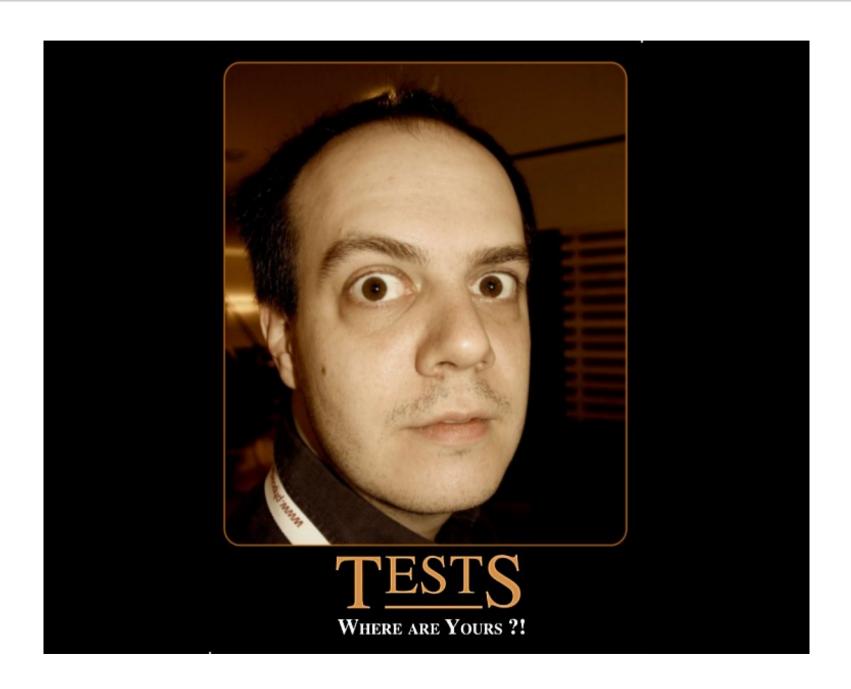

Managers

Ignorance - too much time spent on testing

- Out of date with modern processes
- Belief that testing slows the schedule (only if you follow the ship-and-see process)
- You save time later, because you wouldn't have to retest or re-debug newly written additions or big fixes.

Case Studies

Case Studies

Microsoft Case Study

- TDD project has twice the code quality
- Writing tests requires 15% more time

IBM Case Study

- 40% fewer defects
- No impact on the team's productivity

John Deere / Ericsson Case Study

- TDD produces higher quality code
- Impact of 16% on the team's productivity

Case Studies Developer Comments

- At first I didn't like that I need to write tests for my code, but now after using it for more than 10 months I can't program without it.
- Helps to come up with better APIs.
- It gives confidence that our software is working well at all times. Even after making major changes and/or changing software we are dependent on.
- Productivity increases you might loose some when you make the initial tests, but you'll get it back later.
 The code covered by tests is 'insured' against future changes.
- It works well for libraries, not so well for GUI applications.
- Some things cannot be tested like server errors, unless
